Palliative Care

Understanding Palliative Care

Palliative care helps patients and caregivers manage the symptoms of cancer and side effects of cancer treatment. Learn more about palliative care in this guide.

Who Should Get Palliative Care and Why?

Any person diagnosed with a serious illness who is having symptoms should get palliative care. People with complex medical problems, for instance, someone who is diagnosed with and being treated for heart failure, kidney disease, diabetes, or cancer, should get palliative care. These serious illnesses often lead to physical, [emotional](#)¹, spiritual, and social problems that go beyond what the medical team can provide.

Why palliative care is important in cancer care

For cancer patients, it's important to remember that the effects of cancer and its treatment can be very different from person to person. A palliative care team includes a group of specialists who look at each person's situation and work together to help the patient and caregiver with various types of needs. The palliative care team can help by:

- Controlling physical symptoms and [side effects](#)²
- Managing [emotions](#)³ that come with a cancer diagnosis and treatment
- Showing the family ways to [coping](#)⁴ with life and family changes
- Understanding any spiritual concerns
- Supporting needs of [caregivers](#)⁵
- Assisting with financial, work, and insurance issues
- Helping fill out [advance directives](#)⁶ and other forms
- Transitioning to [hospice care](#)⁷ if treatment stops working or if cancer worsens

Palliative care should be offered and be available from the time of diagnosis until it's no longer needed – at any stage and in any care setting.

Benefits of palliative care

There are many studies that show the benefits of palliative care on the well-being of patients and their families or caregivers. For example, studies have shown that patients who have palliative care visits while in the hospital spend less time in intensive care units and are less likely to visit the emergency room or to be re-admitted to the hospital after they go home. Studies have also shown that people with chronic illnesses, like cancer, who get palliative care have less severe symptoms. They have better quality of life, less pain, less shortness of breath, less depression, and less nausea.

Research has also shown that cancer patients receiving palliative care have better emotional health. This may be because their medical care tends to better align with their values, goals, and preferences. Their families also feel more satisfied with the patient's care.

Some studies have also suggested that starting palliative care soon after a cancer diagnosis may also extend survival.

How and Where Is Palliative Care Provided and How Is It Paid For?

Palliative care is most often offered and started by the cancer care team who is giving your treatment. The doctors and nurses you see during your treatment visits may provide some palliative care themselves, such as helping to [manage symptoms](#)¹ and side effects like nausea or pain. And, they will continue to help control those problems while you are getting treatment. But they will often refer patients to a team of palliative care specialists.

This palliative care "team" typically includes a palliative care doctor (who may be board-certified in Hospice and Palliative Medicine), a palliative care nurse, social worker, dietitian, patient navigator, and maybe a person with a spiritual role such as a pastoral counselor or chaplain.

Many hospitals and oncology clinics have these teams as part of the services they provide. With many types of professionals, the palliative care team can better help with symptoms and problems that are harder to manage, like severe pain, family distress, insurance issues, or complex medical problems.

Where palliative care is given

Palliative care is most often given to the patient in the home as an outpatient, or during a short-term hospital admission. Even though the palliative care team is often based in a hospital or clinic, it's becoming more common for it to be based in the outpatient setting.

The palliative care team also can see patients, family, and caregivers in intensive care units, emergency rooms, treatment centers, or hospital units.

Most actual palliative care happens at home. At home, you may take medicines and use other methods prescribed by the team, or your family members and loved ones might need support as they help care for your needs. The team provides support to the patient as well as to the home caregivers.

You can read more about caregiving in [What a Cancer Caregiver Does](#)².

How palliative care is paid for

Palliative care can be covered by both government and private insurance plans, but it may be part of **chronic care** or **long-term care** coverage. Sometimes it's included in the [hospice care](#)³ part of coverage depending on how the health plan describes what palliative care is.

It's important to check and see if your insurance coverage has certain limits on palliative care, such as a list of what types of serious illnesses are covered, or other situations that may or may not be eligible for palliative care services.

There can also be limits on where palliative care is provided. Coverage may differ if you are getting palliative care in the hospital, rehab, or a skilled nursing or hospice facility instead of getting it at home. Sometimes nursing visits, social work, and spiritual care are covered, in addition to the care and medicines that help control symptoms. It's best to check with your health insurance company for details about what is covered and what is not.

Finding a Palliative Care Program

In most cases, your doctor or cancer care team can offer and start palliative care services. But if palliative care is not offered or available (or for some other reason), they can refer you to a specialized palliative care provider or palliative care team.

Maybe you want to learn more, or would like to talk to more than one provider who offers palliative care. In these cases, there are organizations that keep lists to help you find a palliative care team or palliative care provider. You may also find palliative care information and referral services through the American Cancer Society by searching [Find Support Programs and Services in Your Area](#)¹

You will also need to contact your insurance company to check if you are eligible and to get a list of palliative care providers, teams, or centers.

The following organizations have listings of palliative care providers.

- [Center to Advance Palliative Care](#)²
- [Get Palliative Care](#)³
- [National Hospice and Palliative Care Organization](#)⁴

Questions to Ask About Palliative Care

If your health care team has mentioned palliative care, you should understand its benefits and limitations. Consider asking your oncologist or oncology nurse these questions to learn as much as you can about your care options.

- Are you recommending palliative care for me? Why?
- How do I find out if I'm eligible?
- What is included in palliative care that's different from the care you can give me?
- Who will be part of my palliative care team?
- Where will I receive palliative care?
- Do I need to check with my insurance company about coverage for palliative care?
- How long will my palliative care last?

- What will the palliative care team do if my symptoms get worse? What if my symptoms get better?
- How will you communicate with the palliative care team and my other doctors?
- How are my family and friends involved in palliative care?
- What decisions do I need to make? Can you be involved in those decisions with me?
