After Childhood Leukemia Treatment

Living as a Childhood Leukemia Survivor

For many people, cancer treatment often raises questions about next steps as a survivor.

- What Happens After Treatment for Childhood Leukemia?
- Social and Emotional Issues During and After Treatment of Childhood Leukemia

Cancer Concerns After Treatment

Treatment may get rid of the cancer, but it is very common to have questions about late and long-term effects of treatment down the road.

- Late and Long-term Effects of Treatment of Childhood Leukemia

What Happens After Treatment for Childhood Leukemia?

During and after treatment for childhood leukemia, the main concerns for most families are the short- and long-term effects of the leukemia and its treatment, and concerns about the leukemia coming back.

It’s certainly normal to want to put the leukemia and its treatment behind you and to get
back to a life that doesn’t revolve around cancer. But it’s important to realize that follow-
up care is a central part of this process that offers your child the best chance for
recovery and long-term survival.

Follow-up exams

For several years after treatment, regular follow-up exams will be very important. The
doctors will watch for possible signs of leukemia, as well as for short-term and long-term
side effects of treatment.

Checkups typically include careful physical exams, lab tests, and sometimes, imaging
tests. These checkups will usually be monthly during the first year, and then less often
for at least 5 years after therapy. After that time, most children see their doctor at least
yearly for a checkup.

If leukemia does come back, it is most often while the child is still being treated or within
a year or so after finishing treatment. It is unusual for an acute leukemia (ALL or AML)
to return if there are no signs of the disease within the next 2 years.

A benefit of follow-up care is that it gives you a chance to discuss questions and
concerns that come up during and after your child’s recovery. For example, almost any
cancer treatment can have side effects. Some go away soon after treatment, but others
can last a long time\(^1\), or might not even show up until years later. It’s important to report
any new symptoms to the doctor right away, so that the cause can be found and
treated, if needed.

Keeping good medical records

As much as you might want to put the experience behind you once treatment is done,
it’s very important to keep good records of your child’s medical care during this time.
This can be very helpful later on as your child changes doctors. Gathering the details
during or soon after treatment may be easier than trying to get them at some point in the
future. Be sure the doctors have the following information (and always keep copies for
yourself):

- A copy of the pathology reports from any biopsies or surgeries.
- If your child had surgery, a copy of the operative report.
- If your child stayed in the hospital, copies of the discharge summaries that the
doctor wrote when your child was sent home.
- A list of the final doses of each chemotherapy drug or other drug your child
received. (Certain drugs have specific long-term side effects.)

- If radiation therapy was given, a summary of the type and dose of radiation and when and where it was given.
- The names and contact information of the doctors who treated your child’s leukemia.

It’s also very important to keep health insurance coverage. Tests and doctor visits cost a lot, and even though no one wants to think of the leukemia coming back, this could happen.

Social and Emotional Issues During and After Treatment of Childhood Leukemia

Social and emotional issues may come up during and after treatment. Factors such as the child’s age when diagnosed and the extent of treatment can play a role here.

Some children may have emotional or psychological issues that need to be addressed during and after treatment. Depending on their age, they may also have some problems with normal functioning and school work. These can often be overcome with support and encouragement. Doctors and other members of the health care team can also often recommend special support programs and services to help children after treatment.

Many experts recommend that school-aged patients attend school as much as possible. This can help them maintain a sense of daily routine and keep their friends informed about what is happening.
Friends can be a great source of support, but patients and parents should know that some people have misunderstandings and fears about cancer. Some cancer centers have school re-entry programs that can help in these situations. In these programs, health educators visit the school and tell students about the diagnosis, treatment, and changes that the cancer patient may go through. They also answer any questions from teachers and classmates. (For more information, see Children Diagnosed With Cancer: Returning to School¹.)

Centers that treat many patients with leukemia may have programs to introduce new patients and their families to others who have finished their treatment. This can give them an idea of what to expect during and after treatment, which can be very important.

Parents and other family members can also be affected, both emotionally and in other ways. Some common family concerns during treatment include financial stresses, traveling to and staying near the cancer center, the possible loss of a job, and the need for home schooling. Social workers and other professionals at cancer centers can help families sort through these issues.

During treatment, children and their families tend to focus on the daily aspects of getting through it and beating the leukemia. But once treatment is finished, a number of emotional concerns can arise. Some of these might last a long time and can include:

- Dealing with physical changes that can result from the treatment
- Worries about the leukemia returning or new health problems developing
- Feelings of resentment for having had leukemia or having to go through treatment when others do not
- Concerns about being treated differently or discriminated against (by friends, classmates, coworkers, employers, etc.)
- Concerns about dating, marrying, and having a family later in life

No one chooses to have leukemia, but for many childhood leukemia survivors, the experience can eventually be positive, helping to establish strong self-values. Other survivors may have a harder time recovering, adjusting to life after cancer, and moving on. It’s normal to have some anxiety or other emotional reactions after treatment, but feeling overly worried, depressed, or angry can affect many aspects of a young person’s growth. It can get in the way of relationships, school, work, and other aspects of life. With support from family, friends, other survivors, mental health professionals, and others, many people who have survived cancer can thrive in spite of the challenges they’ve had to face.
Late and Long-term Effects of Treatment of Childhood Leukemia

Because of major advances in treatment, most children treated for leukemia now live into adulthood, so their health as they get older has gotten more focus in recent years.

Just as the treatment of childhood leukemia requires a very specialized approach, so does the care and follow-up after treatment. The earlier problems are recognized, the more likely it is they can be treated effectively.

Childhood leukemia survivors are at risk, to some degree, for several possible late effects of their treatment. This risk depends on a number of factors, such as the type of leukemia, the type and doses of treatments they received, and the age of the child at the time of treatment. It’s important to discuss what these possible effects might be with your child’s medical team so you know what to watch for and report to the doctor.

Second cancers: Children who have been treated for leukemia are at higher risk of developing other cancers later in life. One of the most serious possible side effects of acute lymphocytic leukemia (ALL) therapy is a small risk of getting acute myelogenous leukemia (AML) later on. This occurs in about 5% of patients after getting chemotherapy drugs called epipodophyllotoxins (etoposide, teniposide) or alkylating agents (cyclophosphamide, chlorambucil). Of course, the risk of getting these second cancers must be balanced against the obvious benefit of treating a life-threatening disease such as leukemia.

Heart and lung problems: Certain chemotherapy drugs or radiation therapy to the chest can sometimes cause heart or lung problems later in life. The risks of heart disease and stroke are much higher among those treated for ALL as children, so careful
follow-up is very important. ALL survivors are also more likely to be overweight and to have high blood pressure, which can contribute to these problems.

**Learning problems:** Treatment that includes radiation therapy to the brain or some types of chemotherapy may affect learning ability in some children. Because of this, doctors try to limit treatments that could affect the brain (including radiation) as much as possible.

**Growth and development:** Some cancer treatments may affect a child’s growth, so they may end up a bit shorter as adults. This is especially true after stem cell transplants. This can be helped by treating survivors with growth hormone, if needed.

**Fertility issues:** Cancer treatment may also affect sexual development and ability to have children later in life. Talk to your child’s cancer care team about the risks of infertility with treatment, and ask if there are options for preserving fertility, such as sperm banking. For more information, see [Preserving Fertility in Children and Teens With Cancer](#).

**Bone problems:** Bone damage or osteoporosis (thinning of the bones) may result from the use of prednisone, dexamethasone, or other steroid drugs.

There may be other possible complications from chemotherapy as well. Your child’s doctor should carefully review any possible problems with you before your child starts treatment.

Along with physical side effects, some childhood leukemia survivors might have emotional or psychological issues. They might also have problems with normal functioning and school work. These can often be addressed with support and encouragement. If needed, doctors and other members of the health care team can recommend special support programs and services to help children after cancer treatment.

**Long-term follow-up guidelines**

To help increase awareness of late effects and improve follow-up care for childhood cancer survivors throughout their lives, the Children’s Oncology Group (COG) has developed long-term follow-up guidelines for survivors of childhood cancers. These guidelines can help you know what to watch for, what types of screening tests should be done, and how late effects can be treated.

It’s very important to discuss possible long-term complications with your child’s health care team, and to make sure there is a plan in place to watch for these problems and
treat them, if needed. To learn more, ask your child’s doctors about the COG survivor guidelines. You can also read them on the COG website: www.survivorshipguidelines.org. The guidelines are written for health care professionals. Patient versions of some of the guidelines are available (as “Health Links”) on the site as well, but we urge you to discuss them with your doctor.

For more about some of the possible long-term effects of treatment, see Children Diagnosed With Cancer: Late Effects of Cancer Treatment².
