After Liver Cancer Treatment

Living as a Cancer Survivor

For many people, cancer treatment often raises questions about next steps as a survivor.

- Living as a Liver Cancer Survivor
- Second Cancers After Liver Cancer

Living as a Liver Cancer Survivor

For some people with liver cancer, treatment can remove or destroy the cancer. Completing treatment can be both stressful and exciting. You may be relieved to finish treatment, but find it hard not to worry about cancer coming back. This is a very common concern if you have had cancer.

For many people with liver cancer, the cancer may never go away completely, or it might come back in another part of the body. These people may still get regular treatments with chemotherapy, radiation therapy, or other therapies to help keep the cancer under control for as long as possible. Learning to live with cancer that does not go away can be difficult and very stressful.

Follow-up care

Even if you have completed treatment, your doctors will still want to watch you closely. It
is very important to go to all your follow-up appointments. During these visits, your doctors will ask questions about any problems you are having and might do exams and blood tests, such as alpha-fetoprotein (AFP), liver function tests (LFTs). Imaging tests, such as ultrasound, CT, or MRI scans might also be done. These tests will help look for signs of cancer or side effects of treatment.

Some treatment side effects might last a long time or might not even show up until years after you have finished treatment. Your doctor visits are a good time to ask questions and talk about any changes or problems you notice or concerns you have.

It’s important for all liver cancer survivors, to tell their health care team about any new symptoms or problems, because they could be caused by the cancer coming back, by a new disease, or a second cancer.

**Doctors visits and tests**

If you have been treated with surgery, a liver transplant, or ablation/embolization and have no signs of cancer remaining, most doctors recommend follow-up with imaging tests and blood tests every 3 to 6 months for the first 2 years, then every 6 to 12 months. Follow-up is needed to check for cancer recurrence or spread, as well as possible side effects of certain treatments.

**Follow-up after liver transplant:** A liver transplant can be very effective at treating the cancer and replacing a damaged liver. But this is a major procedure that requires very close follow-up after treatment. Along with monitoring your recovery from surgery and looking for possible signs of cancer, your medical team will watch you carefully to make sure your body is not rejecting the new liver.

You will need to take strong medicines to help prevent rejection. These medicines can have their own side effects, including weakening your immune system, which can make you more likely to get infections.

Your transplant team should tell you what to watch for in terms of symptoms and side effects and when you need to contact them. It is very important to follow their instructions closely.

**Anti-viral treatment:** If you have hepatitis B or C that may have contributed to your liver cancer, your doctor may want to put you on medicines to treat or help control the infection.

**Ask your doctor for a survivorship care plan**
Talk with your doctor about developing a survivorship care plan\textsuperscript{2} for you. This plan might include:

- A suggested schedule for follow-up exams and tests
- A schedule for other tests you might need, such as tests to look for long-term health effects from your cancer or its treatment
- A list of possible late- or long-term side effects from your treatment, including what to watch for and when you should contact your doctor
- Suggestions for things you can do that might improve your health, including possibly lowering your chances of the cancer coming back

**Keeping health insurance and copies of your medical records**

Even if you’ve finished treatment, it’s very important to keep health insurance\textsuperscript{3}. Tests and doctor visits cost a lot, and even though no one wants to think of their cancer coming back, this could happen.

At some point after your cancer treatment, you might find yourself seeing a new doctor who does not know about your medical history. It’s important to keep copies of your medical records\textsuperscript{4} to give your new doctor the details of your diagnosis and treatment.

**Can I lower my risk of liver cancer progressing or coming back?**

If you have (or have had) liver cancer, you probably want to know if there are things you can do that might lower your risk of the cancer coming back, such as exercising, eating a certain type of diet, or taking nutritional supplements. Unfortunately, it’s not yet clear if there are things you can do that will help.

Getting treatment for hepatitis B or hepatitis C may help reduce damage to your liver that can increase liver cancer risk. Tobacco and alcohol use has clearly been linked to liver cancer, so not smoking and avoiding alcohol\textsuperscript{5} may help reduce your risk. We don’t know for certain if this will help, but we do know that it can help improve your appetite and overall health. It can also reduce the chance of developing other types of cancer. If you want to quit smoking\textsuperscript{6} and need help, call the American Cancer Society at 1-800-227-2345.

Other healthy behaviors such as eating well, being active, and staying at a healthy weight\textsuperscript{7} might help as well, but no one knows for sure. However, we do know that these types of changes can have positive effects on your health that can extend beyond your
risk of liver or other cancers.

**About dietary supplements**

So far, no dietary supplements (including vitamins, minerals, and herbal products) have been shown to clearly help lower the risk of liver cancer progressing or coming back. This doesn’t mean that no supplements can help, but it’s important to know that so far none have been proven to do so.

Dietary supplements are not regulated like medicines in the United States – they do not have to be proven effective (or even safe) before being sold, although there are limits on what they’re allowed to claim they can do. If you’re thinking about taking any type of nutritional supplement, talk to your health care team. They can help you decide which ones you can use safely while avoiding those that might be harmful.

**If the cancer comes back**

If your cancer does come back at some point (called a recurrence), your treatment options will depend on the where the cancer is, what treatments you’ve had before, and your health. Treatment options might include ablation, embolization, radiation therapy, chemotherapy, targeted therapy, or some combination of these. See [Treatment of Liver Cancer, By Stage](#).

For more general information on cancer recurrence, see [Understanding Recurrence](#).

**Second cancers after treatment**

People who’ve had liver cancer can still get other cancers. Learn more in [Second Cancers After Liver Cancer](#).

**Getting emotional support**

It is normal to feel depressed, anxious, or worried when liver cancer is a part of your life. Some people are affected more than others. But everyone can benefit from help and support from other people, whether friends and family, religious groups, support groups, professional counselors, or others. Second Cancers After Liver Cancer

Liver cancer survivors can be affected by a number of health problems, but often a major concern is facing cancer again. Cancer that comes back after treatment is called a recurrence. But some cancer survivors develop a new, unrelated cancer later. This is called a **second cancer**.

Unfortunately, being treated for liver cancer doesn’t mean you can’t get another cancer. People who have had liver cancer can still get the same types of cancers that other people get. In fact, they might be at higher risk for certain types of cancer.

Studies looking at the second cancers liver cancer survivors can get are not easy to do, mainly because of the poor outcomes related to liver cancer. The little information that is known shows that there is an increased risk of:

- Oral cavity cancer\(^1\)
- Ovarian cancer\(^2\)
- Kidney cancer\(^3\)
- Thyroid cancer\(^4\)
For people diagnosed with liver cancer before age 50, there appears to be an increased risk of these second cancers:

- Colon cancer
- Ovarian cancer
- Bladder cancer
- Acute Myeloid Leukemia (AML)

Exactly how high the risk is of developing these second cancers is not known at this time.

**Follow-up after liver cancer treatment**

After completing treatment, you should still see your doctor regularly. Report any new symptoms or problems, because they could be caused by the cancer spreading or coming back, or by a new disease or second cancer.

Liver cancer survivors should also follow the American Cancer Society guidelines for the early detection of cancer, such as those for colorectal, breast, cervical, and prostate cancer. Screening tests can find some cancers early, when they are likely to be treated more successfully. For people who have had liver cancer, most experts don’t recommend any additional testing to look for second cancers unless you have symptoms or if you or your family have an inherited disease.

**Can I lower my risk of getting a second cancer?**

There are steps you can take to lower your risk and stay as healthy as possible. For example, people who have had liver cancer should stay away from tobacco products. Not smoking lowers the chance of developing most lung cancers, and may help decrease the possibility of a new liver cancer forming.

To help maintain good health, liver cancer survivors should also:

- Get to and stay at a healthy weight
- Keep physically active and limit the time you spend sitting or lying down
- Follow a healthy eating pattern that includes plenty of fruits, vegetables, and whole grains, and limits or avoids red and processed meats, sugary drinks, and highly processed foods
- Not drink alcohol. If you do drink, have no more than 1 drink per day for women or
2 per day for men

These steps may also lower the risk of some other health problems.

See Second Cancers in Adults\(^\text{16}\) for more information about causes of second cancers.
